

Credit Name: CSE2920 - CSE Project C

Assignment Name: Blink LED

How has your program changed from planning to coding to now? Please explain?

PLANNING:

I plan to modify the given code to make the green LED flash for two seconds, three times. Explanations of how I modified the code are below:

CODING:

1.

```
//Add Phidgets Library | You added a file called phidget22 when co
import com.phidget22.*;

public class BlinkLED {
    //Handle Exceptions | Exceptions will happen in your code from
    public static void main(String[] args) throws Exception{

        //Create | Here you've created a DigitalOutput object for
        DigitalOutput GreenLED = new DigitalOutput();

        //Address | This tells your program where to find the dev
        GreenLED.setHubPort(4);
        GreenLED.setIsHubPortDevice(true);
```

The Phidgets library is imported

Green LED object was created to interact with the physical phidgets box.

setHubPort was changed to 4, because I need to modify the code to flash green LED instead of the red LED. The Green LED hub number is 4.

IsHubPortDevice set to true (confirming to the program that the green LED is part of the phidgets box).

2.

```
//Open | Open establishes a connec
GreenLED.open(1000);

//Use your Phidgets | Here is whe

    GreenLED.setState(true);
    Thread.sleep(2000);
    GreenLED.setState(false);
    Thread.sleep(1000);
    GreenLED.setState(true);
    Thread.sleep(2000);
    GreenLED.setState(false);
    Thread.sleep(1000);
    GreenLED.setState(true);
    Thread.sleep(2000);
    GreenLED.setState(false);

}
}
```

Opened the Green LED, giving the program 1 second to locate the phidget (established a connection to the physical Phidgets box).

Set state for the Green LED goes from true to false, 3 times. Sleep is set to 2 seconds while led is on, and sleep is set to 1 second while led is off. (The light stays on for 2 seconds and turns off for 1 second).

End of Program!
