

Credit Name: CSE2920 - CSE Project C

Assignment Name: Closing Phidgets

How has your program changed from planning to coding to now? Please explain?

PLANNING:

I plan to modify the given code and see what happens when trying to print temp after a close call, and after opening it again.

CODING:

1.

```
//Add Phidgets Library
import com.phidget22.*;
public class ClosingPhidgets {
    public static void main(String[] args) throws Exception{

        //Create
        TemperatureSensor temperatureSensor = new TemperatureSensor();

        //Open
        temperatureSensor.open(1000);
```

Phidgets library is imported

The temperatureSensor object was created to interact with the physical phidgets box.

Opened the temperatureSensor object establishing a connection to the physical Phidgets box.

2.

```
//Use your Phidgets
System.out.println("Temperature: " + temperatureSensor.getTemperature() + " °C" );

//Close your Phidgets
temperatureSensor.close();

//Open
temperatureSensor.open(1000);
```

Temperature can print if I close and open.

Temperature isn't able to print if I close phidget.

This screenshot shows the close, and open. Temperature can print in this case. If I didn't reopen the phidget, it would not work.

End Of Program!
