

Credit Name: CSE2920 - CSE Project C

Assignment Name: Read Temperature

How has your program changed from planning to coding to now? Please explain?

PLANNING:

I plan to modify the given code so that the output temperature is Fahrenheit instead of Celsius. Explanations of how I modified the code are below:

CODING:

1.

```
//Add Phidgets Library | You added a file called phidget22 when configuring yo
import com.phidget22.*;
public class ReadTemp {

    public static void main(String[] args) throws Exception{

        //Create | Here you have created a TemperatureSensor object. Tempe
        TemperatureSensor temperatureSensor = new TemperatureSensor();

        //Open | Open establishes a connection between your object and you
        temperatureSensor.open(1000);
```

Phidgets library is imported

The temperatureSensor object was created to interact with the physical phidgets box.

Opened the temperatureSensor object establishing a connection to the physical Phidgets box.

2.

```
//Use your Phidgets | This code will print the temperature every 150ms
while (true) {
    System.out.println("Temperature: " + (temperatureSensor.getTemperature()*1.8 +32) + " °F" );
    Thread.sleep(150);
}
```

While loop is used so that the following code keeps running.

Prints the temperature by multiplying the Celsius value by 1.8, and adding 32.

Sleep time of 150ms so the program doesn't excessively print the temperature.

End Of Program!
